State Data Center

The Georgia Technology Authority operates the state data center, which supports more than 100 applications, including those used for tracking child support payments, managing eligibility and electronic benefits transfer for public assistance, issuing drivers' licenses and maintaining birth, death and marriage records. The data center also generates paychecks and handles pension administration for state employees.

Enterprise Network Operations Center

The ENOC monitors the state's communications network on a continuous basis for circuit outages and related problems. It tracks telephone, data and Internet traffic at state government agencies around the state and often notifies an agency about problems before they become apparent to users. It tests circuits, diagnoses problems and notifies the state's telecom vendors so they can begin repairs. The ENOC maintains and repairs network equipment owned by the state, such as switches and routers. It also looks for unusual activity that may indicate a virus or worm and works closely with GTA's network security team to protect the network from intruders.
